

SECANT PILES

The execution of secant piles is part of Soiltech's broad range of services for some years now. We recently invested in three additional drilling rigs to strengthen our position within this market. By using multifunctional machines (which can also be used for the soilmix technique and for the installation of gravel cores and bored piles), Soiltech can simultaneously deploy several machines for the installation of secant piles. That is exactly why Soiltech is your partner of choice for executing large-scale projects in a short period of time, even in the most difficult circumstances. We can, for instance, drill very close to existing buildings, without causing vibrations or any risk of subsidence.
